

Phlebotomy Skills In House Training

Developing Practice Skills

In House Phlebotomy Training

We deliver Phlebotomy Training throughout the country and overseas.

We have trained private individuals, scientists, healthcare professionals, PhD students and medical students, and we have worked with some of the major universities and healthcare organisations in the country.

Our courses are accredited by the Aim Group, are scrupulously internally and externally verified, have a duration of 16 hours contact time and require a similar period of home study.

Our level 3 Phlebotomy Skills course lasts two days and gives a comprehensive grounding in phlebotomy.

We can deliver our Understanding and Applying Phlebotomy Skills and Techniques training to your staff on your premises.

The first (mainly theoretical) day comprises of

- The background to phlebotomy
- Health and safety in phlebotomy
- Infection control
- Anatomy and physiology of the arm
- Site selection – good and bad veins
- Complications that can arise when taking blood
- Needlestick Injuries, what they are and what to do
- How and where to correctly apply a tourniquet
- What is expected of a phlebotomist
- The importance of correct patient identification and informed consent

At the end of the first day all participants are given a multiple choice quiz to complete - and have to achieve a minimum standard to continue on to:

The second (mainly practical) day will comprise of

- A summary of the most common blood tests undertaken
- A guide to common types of equipment used in venepuncture and how to use them.
- The technique of venepuncture
- The process of taking blood
- The correct use of safer sharps

The day includes a period of role play using pads attached to antecubital fossa area, a period of one to one supervised practice using an artificial arm to improve technique and a 20 minute clinical assessment of each candidate.

Upon completion of the course the participants are required to undertake a programme of home study and to produce 5 short pieces of written work.

To deliver the training we would need a room suitable to deliver the theory day, with scope to project a powerpoint onto a wall or screen - and a second smaller room to use to undertake one to one training and clinical assessments on the second day while the other participants continue to work in the other room.

Although we deliver a standardised course we can, to a degree, tailor our training to meet the needs of any given group of staff – please contact us to discuss any specific requirements that you may have.
